AN ELDERLY WOMAN IS FOUND unconscious in a supermarket aisle. Unresponsive, she is rushed to the emergency room. Upon regaining consciousness, she complains of a severe pain in her abdomen. There are many possible reasons for the pain, so a pathologist is called in to help solve the mystery. Blood and urine samples are taken and the pathologist examines them under a microscope. What the pathologist sees leads to a conclusive diagnosis. Now that the cause is known, the medical team can begin treatment. Pathologists are like detectives, fascinated by the process of disease and dedicated to finding answers to medical mysteries. They use sophisticated tools and methods of modern laboratory science to identify and diagnose cancer, AIDS, diabetes, and many more diseases and health problems. Pathology literally means the study of disease, and consequently its scope is vast. Thousands of clinical, genetic, and microbiological tests are requested each day. It is the pathologist s job to examine tissue and body fluid samples, and provide expert interpretations of the results in order to facilitate diagnosis and treatment plans. There are two main kinds of medical pathologists: clinical and anatomic. Clinical pathologists spend the majority of their time in the laboratory, examining blood, urine, and other body fluid samples in search of the cause of a disease. They are key members of the medical team, which uses their findings to diagnose and treat patients. Anatomic pathologists also analyze tissue and cell samples in order to determine the diagnosis and cause of diseases. The difference is the anatomic pathologist uses samples removed via surgery, biopsies, or fine needle aspirations. Their services are often needed urgently, while a patient is undergoing surgery....
